To help support our mission, we may earn affiliate commissions from links contained on this page. JLab offers three basic types of headphone and earbud models, and the Bluetooth pairing process varies depending on the type of product you have. So if you're having trouble figuring out how to connect your JLab device to Bluetooth, I'll walk you through these steps for each type: Turn on pairing mode for your JLab device (see specific instructions below) Find your JLab device on your phone or laptop and pair them Confirm successful pairing Troubleshoot your Bluetooth connection. 1. Turn on pairing mode for your JLab headphones or earbuds JLab has three different types of devices - true wireless earbuds, wireless earbuds and headphones - and each has its own method of turning on pairing mode. True Wireless Earbuds (models include the Jbuds Air, Jbuds Air SPort, JBuds Air Executive and Epic Air Sport) The pairing process for JLAB true wireless earbuds is unusual in that it requires holding down the Multi-function button on BOTH earbuds for at least 3 seconds to turn them on and get them into pairing mode. You should see the left earbud LED turn solid white and the the right earbud LED blink blue and white to show they are ready to pair. On some models, such as the Epic Air Elite, both earbuds may blink blue and white. Wireless Earbuds (models include JBuds Pro, Metal, JBuds Elite, Fit 2.0, Fit Sport, Fit Sports 3 Earbuds) Press and hold the Multi-function button for 10 seconds. The LED will blink red and blue to indicate it is ready for pairing. Headphones - on-ear and over-the-ear (models include Flex Sport, JBuddies Play Gaming Wireless Kids, Neon Wireless, Omni Folding, Play Gaming Wireless Headset, Rewind Bluetooth, Rewind Icon, Rewind Retro, Studio Wireless, Studio ANC, Studio Icon, and Studio On-Ear) With the JLab headphones powered off, press and hold the Power button for 10 seconds. The LED will blink red and blue when ready for pairing. LED color may vary by model, and some models will also provide a verbal "hello" when ready for pairing. 2. Find your JLab device on your phone or laptop and pair them Android. Go to Settings and turn on Bluetooth. In Bluetooth click "Pair new device". When you see your JLab headphones or headset come up in the list, tap it and it should be paired with your phone. iPhone. Go to Settings and then Bluetooth. Turn on Bluetooth. Look for your JLab device under "OTHER DEVICES" and tap on it to connect. MacOS. On your Mac, choose Apple menu > System Preferences, then click Bluetooth. Select your JLab device from the list, then click Connect. If asked, click Accept. Windows 10. Open "Bluetooth & other devices" in the System Settings either by clicking on your Bluetooth button in the tool bar and selecting "Show Bluetooth devices". If the Bluetooth button is hidden, you'll find it under the upward arrow on the task bar at the bottom of your display (see below). When the Add a device window comes up, click "Bluetooth". Look for your JLab device in the list and tap on it to connect. Alternatively, search for "Bluetooth" in your Windows search box. When the Bluetooth & other devices window comes up, make sure Bluetooth is on then click "Add Bluetooth or other device" and select your device from the list. 3. Confirm successful pairing When you have successfully paired your JLab device to your phone or laptop, the LED will either stop blinking and blink slowly, depending on model. Some models will also give you a verbal cue that the headphones have successfully paired. 4. Troubleshooting your Bluetooth connection If you have followed the steps above and your device still isn't pairing, try clearing your existing paired devices on your phone or laptop and re-pair to your headphones or headset. If this doesn't work, get more ideas in our detailed guide on how to fix Bluetooth pairing problems. Looking for a new pair of headphones? Take a look at our picks for the best Bluetooth headphones under \$50. Image credits: JLab, Techlicious JLab, founded in 2005, is an American consumer electronics company. They're the number 1 manufacturer in wallet-friendly, truly wireless earbuds. While their product quality is exceptional, occasionally they will have issues pairing—this isn't a problem exclusive to JLab—but there are some troubleshooting steps to try. Bluetooth has always been a touchy communication protocol and if your JLab Earbuds aren't pairing, it's likely a matter of resetting the host device or the earbuds to get them synced and ready to go. Bluetooth is notoriously flaky, and that's not likely to change anytime soon. Bluetooth has a poor range, is extremely vulnerable to interference, and is a massive leech on battery-powered devices. If your JLab earbuds won't pair, it's almost a certainty that Bluetooth is at fault. How To Reset Your JLab Earbuds There are a few different brands within the JLab "family," and each one has its reset procedure. Regardless of which JLab you own, you'll first have to go into the host Bluetooth device—smartphone, tablet, PC, etc.—and "forget" the JLab earbuds. JLab Air (Executive, Sport, and V2): Place both Earbuds back in the case. While they are in the case, tap one earbud quickly, four times and it will flash a blue light 3x. Do the same with the opposite earbud. Remove them from the case and, if done correctly, both buds will flash alternating white and blue lights, which means they are "discoverable" and ready to pair. JLab Air V1: Make sure that both earbuds are turned off. Press and hold one earbud until it flashes white (approximately 15 seconds). Do the same with the second earbud. Now the earbuds will connect and the right earbud will flash blue and white (ready to pair). JLab Epic ANC: This works the same as the Executive, Sport, and V2, except you, will tap each earbud (while they're in the case) 7x instead of 4x. Once you've tapped both earbuds, remove them from the case and they will each alternate blinking white and blue, ready to pair. JLab suggests that the process may take more than one effort and if three times doesn't do the trick, contact JLab Customer Support for warranty coverage and possible exchange. Once the JLab headphones are reset and ready to pair again, they should show up in whichever host device you are trying to pair them with. Alexa is a known, epic nightmare when it comes to pairing earbuds to Echo devices. If you're attempting to do that, good luck. JLab Earbuds Not Paired With Each Other The troubleshooting steps for getting JLab earbuds to pair with each other are the same as the above instructions for getting them to pair to a host device. However, you can also try a few other things to see if you can get them to pair before you try resetting them. Turn both earbuds off and set them in the case cradle. Leave them in there for a full minute before powering them back on and taking them out. Hold them less than 2" apart and see if they'll pair. Without turning them off, set them in their cradle for a full minute before taking them out again. Hold them less than 2" apart until they've successfully paired. Return the JLab earbuds to their case. Turn the Bluetooth off on the host device. Remove them from their case and hold them less than 2" apart. If they pair up, turn on the Bluetooth from the host device and see if they'll pair. Make sure that before you take the earbuds out of their case, you are away from other electronics or anything communicating with your host device or your WiFi router. When both devices have established a connection with each other, one will flash white and the other blue, so you'll know they've successfully paired. Even the latest Bluetooth version 5.2 is subject to interference. Even WiFi, which has trouble penetrating plastic, metal, rubber, and masonry, has a better track record than Bluetooth when it comes to resisting interference. JLab Audio Dropping In And Out Occasionally, you may have problems with the audio skipping or just dropping out completely. Nine times out of ten, this is a problem with interference or distance, so there's a couple of things you can try to restore functionality. If you're more than 20' away from the host device, try moving closer. If it's a smartphone, it's best to keep it in your back pocket or at least within a few feet of your earbuds. If it's still giving you problems, turn the Bluetooth off on your host device and turn it back on to restore the connection. It's usually best to turn it off for a full minute before trying again. Remove the JLab earbuds from your ears and place them back in the case. Turn the Bluetooth off on your host device and wait a full minute. Turn the Bluetooth back on and remove the earbuds from the case to try and reestablish a connection. Reset the JLab earbuds as outlined above. You can also try turning off the host device and turning it back on before removing the earbuds again. Audio dropping in and out isn't an uncommon occurrence with Bluetooth devices. Generally speaking, you can solve the issue by moving closer to increase the power of the connection. However, Bluetooth can be silly sometimes. If the primary Bluetooth connection is with your right earbud and your smartphone is in your left pocket, you'd be surprised at how effective it often is to move the cell phone to your right pocket. All Things Considered JLab is no stranger to wireless earbud technology, and they have produced quality products for 16 years. If you're experiencing issues pairing to a host device, the earbuds not pairing with each other, or audio skipping, it's more likely a Bluetooth issue rather than the JLab earbuds. The troubleshooting steps above will help you get your JLab earbuds working again and let you enjoy the value of truly wireless audio for years to come. link to Why is Hulk Not on Disney Plus? link to Does AppleCare Cover Water Damage?
